How to use face detection when design is connected to a DB

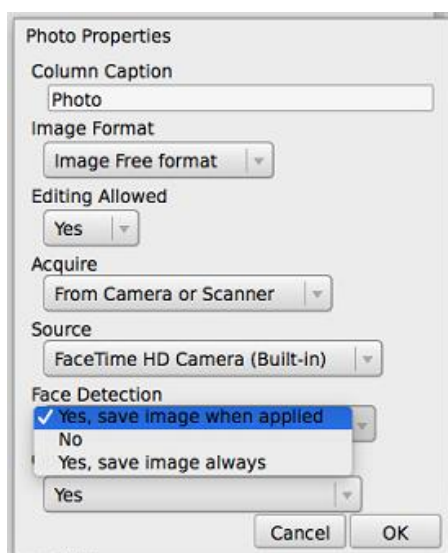

When a design is connected to a database, there are two ways to use the face detection.

1. Apply Face Detection to images on DB.

To save in the database the photo centered on the face or to apply on the design the photo centered on the face, whether the original image is centered or not.

To save in the database the photo centered on the face, change the Face Detection to:

- “Yes, save image when applied” – to save the image on the DB only when Face Detection is applied correctly, ensuring that only qualified images are saved.
- “Yes, save always” – to save the image on the DB even if Face Detection is not applied correctly.

2. Apply Face Detection only in the Design

To save the original photo in the DB, but use a centered one in the design, go to Columns' properties and confirm that the option Face Detection "No".

Select the photo item in the design and click in the Source tab and choose between the options:

- "Yes, save image when applied" – to show the image in the design only when Face Detection is applied correctly, ensuring that only qualified images are printed.
- "Yes, save always" – to always show the image on the design.
