## How to create a DB list field

Using a **DB List Field** ensures that only the correct data is saved in the database.

It also eases the task and makes it less error prone by avoiding typing the same data again and again.

To configure a **List field** in ID Builder, click in the **column's properties** button and choose "**List**" option.

Click in the properties button and fill the table:

- Text: corresponds to the text that is visible in the List and saved in the database.
- Data: fill this column to save in the DB a different value, that what appears in the List, like a match table.

As illustrated in the screenshot below, the operator will only see "Electronics" but the value "1L23AS\_ELEC" will be saved in the database and in the design.
